PRISMATIC INFILL

A SUBURBAN PROTOTYPE

Austin, Tx | Spring 2026

A single modular house testing a repeatable timber-frame system, explored further in Timber Framing, and scaled into the multi-unit community in Living Infrastructure.

Prismatic Infill rethinks attainable housing as a compact, repeatable system of domed volumes that can be inserted into a typical Austin residential lot. The dome geometry distributes structural load evenly, reducing material demand while supporting large, continuous interior volumes and encouraging natural air circulation in Austin's hot climate. Trapezoidal cuts carve circulation, stairs, and openings into the domes, creating compression and expansion that guide movement while enhancing daylight and cross-ventilation throughout the structure.

CIRCULATION

SECTION (EAST)

THESE GEOMETRIC INTERVENTIONS
GUIDING MOVEMENT WHILE ENHANCING

The image consists of three isometric diagrams illustrating the construction of a building, likely a bunker or a secure structure, using precast concrete blocks.

- Top Diagram:** Shows individual precast concrete blocks. Some blocks have a trapezoidal shape with a square opening on top, while others are rectangular. They are shown in a disassembled state.
- Middle Diagram:** Shows the blocks assembled into a rectangular frame. The interior of the frame is divided into several smaller rooms or compartments. Stairs are visible within some of these compartments, indicating a multi-level structure. The blocks are colored in a light green shade, representing soil or a specific material type.
- Bottom Diagram:** Shows the completed structure. The blocks are now joined together, and vertical rods (reinforcement) are inserted into the top of the structure, suggesting a reinforced concrete construction. The interior layout with stairs remains visible.

SECTION (NORTH)

PASSIVE SOLAR DESIGN

Optimized orientation and the roof domes help maximize winter solar gain while reducing the summer heat

HIGH-PERFORMANCE ENVELOPE

Continuous insulation throughout the interior and includes airtight detailing

LOW-CARBON MATERIALS

Renewable timber and the use of low VOC helps create interior space with low embodied carbons

CROSS LAMINATED TIMBER (CLT)
(INTERIOR WALLS)

LIVING INFRASTRUCTURE

MULTI-UNIT URBAN RESIDENTIAL

Austin, Tx | Spring 2026

The Prismatic Infill module scaled from a single house into a connected, multi-unit urban residential community on the same Austin site.

This project tests whether one repeatable housing module can scale from an individual home into a full community. Interconnected volumes establish a hierarchy of private units, shared circulation, and communal space. The idea was to preserve each unit's access to natural daylight, outdoor space, and spatial identity even as density increases.

LIVING INFRASTRUCTURE-BUILDING B, 1/4 SCALE MODEL

This model shows Building B's mix of private, public, and semi-private spaces. The left hinge reveals a private unit for multi-generational living, while the right hinge opens onto a semi-private space with a ground-floor arcade and upstairs media room. Each unit is organized to help balance community space with private living.

LIVING INFRASTRUCTURE-SITE PLAN MODEL, 1/16 SCALE

This model represents the existing urban site in Austin, with color marking each space's function. Dark blue at the center denotes shared plazas and walkable paths; white marks private housing, pink marks semi-public space, and light blue marks fully public space across the four massings.

TIMBER FRAMING

BONE + STRUCTURE MODEL FOCUS

Model Before/After | Spring 2026

The structural model study behind the timber-frame system used in Prismatic Infill and Living Infrastructure — shown here in its two iterations, before and after refinement.

First iteration: a vertical timber-beam frame with trapezoidal dome voids and slanted skylights. This system defined the massing but left the domes structurally disconnected from the frame below, which was later the problem the second iteration set out to solve.

SECOND ITERATION: THE VERTICAL BEAM SYSTEM WAS REPLACED WITH A V-SHAPED TRUSS FRAME, TYING THE DOME GEOMETRY DIRECTLY INTO THE BUILDING'S STRUCTURAL LOGIC RATHER THAN TREATING IT AS AN APPLIED FORM.

TRINITY BATHHOUSE

WELLNESS + COMMUNITY BATHHOUSE

Dallas, Tx | Fall 2025

Trinity Bathhouse organizes a communal wellness complex along a central axis of grouped massing, with the baths themselves as the unifying element for each cluster. A stacked, terraced system of central staircases keeps the front baths aligned along that axis, while the rear baths break from it asymmetrically to help open the plan toward the surrounding levee and framing views beyond the site.
